TITLE: Telomerization of dimethylcyclosiloxanes as a method for preparing monomers and oligomers with various functional groups

SOURCE: AN SSSR. Institut neftekhimicheskogo sinteza. Sintez i svoystva monomerov (The synthesis and properties of monomers). Moscow, Izd-vo Nauka, 1964, 160-163

TOPIC TAGS: telomerization, silicoorganic compound, cyclosiloxane, siloxane polymer, chlorosilane copolymer, nucleophilic substitution

ABSTRACT: A general method for preparing oligomers of dimethylcyclosiloxanes with terminal functional groups is proposed and the reaction mechanism is discussed. The method is based on the published experimental studies of Andrianov et. al. Dimethylcyclosiloxanes were telomerized with alkyl- or arylchlorosilanes to react by the formula

Card 1/3

L 22657-65

ACCESSION NR: AT5002127

where m=3, 4; R¹, R², R³ = alkyl, aryl, or Cl; n = 1, 2, 3 or higher. The compound is contained chlorine atoms attached to silicon but the chlorine may be exchanged by suitable reagents to obtain hydroxy, alkoxy, acetoxy, or other functional terminal groups. The mechanism involves the formation of intermediate complexes with pentavalent silicon as shown in Fig. 1 of the Enclosure for RSiCl_3 . The weakening of the oxygen-silicon bonds in dimethylcyclosiloxane causes ring cleavage with addition of Cl to Si, and of the methyl-dichlorosilyl group to oxygen. The reaction can be defined as ionic, and as involving nucleophilic substitution of chlorine at the silicon atom in molecules of alkyl- or aryl-chlorosilanes by the group $(\text{CH}_3)_2\text{SiO}$ of dimethylcyclosiloxane. Telomerization proceeds in the presence of FeCl_3 or of other aprotic acids such as AlCl_3 , TiCl_4 or SnCl_4 . The mechanism is discussed in terms of the electronic structure of the substituting groups, and possible side reactions are explained. Orig. art. has: 1 table and 2 formulas

TITLE: The telomerization reaction of dimethylcyclosiloxanes? Communication 6.
Reaction of hexamethylcyclotrisiloxane with methyldichlorosilane, methylvinyl-
dichlorosilane and methylphenyldichlorosilane

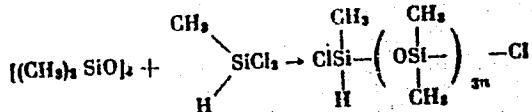

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 7, 1964, 1268-1271

TOPIC TAGS: dimethylcyclosiloxane, telomerization reaction, hexamethylcyclotri-
siloxane methyldichlorosilane, hexamethylcyclotrisiloxane methylvinylchloro-
silane, hexamethylcyclotrisiloxane methylphenyldichlorosilane, reaction product,
organodichlorosilane reactivity, hexamethylcyclotrisiloxane oligomer

ABSTRACT: A method was worked out for the synthesis of linear bifunctional oligomers of hexamethylcyclotrisiloxane (HMCT) containing Si-H or vinyl or phenyl radicals based on the reaction of HMCT with methyl-, methylvinyl- or methylphenyl-dichlorosilanes. The reaction proceeded via a mechanism in which the Si-H bond was not disturbed. Up to 97% conversion of HMCT was obtained upon reaction with methyl dichlorosilane (1:1 and 2:1 ratio):

Card 1/3

L 6612-65
ACCESSION NR: AP4042872

The higher HMCT ratio resulted in the formation of a higher yield of the higher telomers (14.3 instead of 3.9% of $n > 4$, 42.8 instead of 7.1% $n = 2$, 31.8 instead of 83.1% $n = 1$) indicating the activity of the methylidichlorosilane was higher than the activity of the telomers formed. Similar reactions were run with methylvinyl- and methylphenyldichlorosilane, (95 and 49% conversion, respectively) forming analogous telomers containing -Si-CH=CH_2 and $\text{-Si-C}_6\text{H}_5$ radicals instead of the Si-H. When the vinyl telomer with $n = 1$ (1,7-dichloro-1-vinylheptamethyltetrasiloxane) was reacted with HMCT, a 67% yield of the $n = 2$ telomer was obtained. The reactivity of the organodichlorosilanes in the telomarization reaction with HMCT decreased in the series; $\text{CH}_3\text{HSiCl}_2 > \text{CH}_2=\text{CHCH}_3\text{SiCl}_2 > \text{C}_6\text{H}_5\text{CH}_3\text{SiCl}_3$. TITLE: The telomerization reaction of dimethylcyclosiloxanes. / Communication 7.
Preparation of dimethylsiloxane oligomers with functional groups in the organic radical.

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 7, 1964, 1271-1275

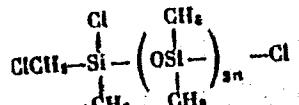

TOPIC TAGS: telomerization, dimethylsiloxane oligomer, synthesis, functional group containing oligomer, hexamethylcyclotrisiloxane, polar group containing organosiloxane, organosiloxane activation

ABSTRACT: Dimethylsiloxane oligomers which contained functional groups in the organic radical in addition to Si-Cl bonds were synthesized, and the effect of the functional group and its polarization in the organic radical on the reactivity of the organochlorosilane in the telomerization reaction of hexamethylcyclotrisiloxane (HMCT) was explained. The following (chloroalkyl)alkylchlorosilanes containing functional atoms in the organic radical in the α , β and γ position with respect to the Si atom were reacted with HMCT: (chloromethyl)dimethylchlorosilane (I),

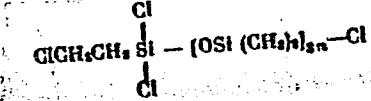

Card 1/3

L 6611-65
ACCESSION NR: AP4042873

(chloromethylmethyldichlorosilane (II), β -chloroethyltrichlorosilane (III), γ -chloropropyltrichlorosilane (IV), and β -cyanoethyltrichlorosilane (V). Reaction of HMCT with the alpha-chloro substituted compounds I and II gave a telomer of the formula

where $n = 1, 2$ or 3 . When $n = 1$ there were no breakdown products, but with n was equal to 2 or more, 2, 3 and 4 Si-atom breakdown products were formed, indicating lowered activity of the telomer in comparison with the initial monomer. Reaction with III gave the telomer

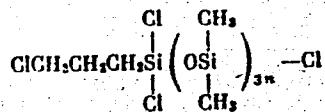

with 39.1% yield of $n = 1$ and 10.5% of $n = 2$. Reaction with IV gave the telomer

Card 2/3

L 6611-65

ACCESSION NR: AP4042873

With $n = 1$ or 2, and in the reaction with V the Si-O-Si bond rupture was so intense only cleavage products of HMCT were obtained. Introduction of polar groups in the organic radical of the organosiloxanes activated them in the telomerization reaction with HMCT. The activity of the chlorosilanes decreased in the series

$\beta > \alpha > \gamma$ and the CN group had a greater effect than the Cl group.

TITLE: Changes in the fine and porous structures of phenol-formaldehyde resin during rapid short-duration heating to high temperatures

SOURCE: Plasticheskiye massy, no. 9, 1964, 13-17

TOPIC TAGS: phenolic plastic, polymerization, heat effect, crystal chemistry, polymer structure

Abstract: Changes in the structure of GOST 4559-49 phenol-formaldehyde resin have been studied during rapid short-duration heating up to 2900°C. The initial resin was cured for about 20 days at 160°C; its degree of polymerization was 98.2%. The specimens were heated at rates of 10,000—20,000°C/min. Heating was conducted in increments of 100° below 1100°C and 300° above 1100°C, with a 1-min holding time at each temperature. The samples were then cooled in nitrogen. Changes in the porous structure of the specimens were studied by visual observation, micrographs, and porosity measurements based on moisture absorption. In addition, weight loss, shrinkage, and compressive

Card 1/6

L 24674-65

ACCESSION NR: AP5004687

strength of the specimens were determined. The results of the study are given in the form of micrographs and plots of porosity and weight versus temperature (see Fig. 1) and shrinkage and strength versus temperature (see Fig. 2).

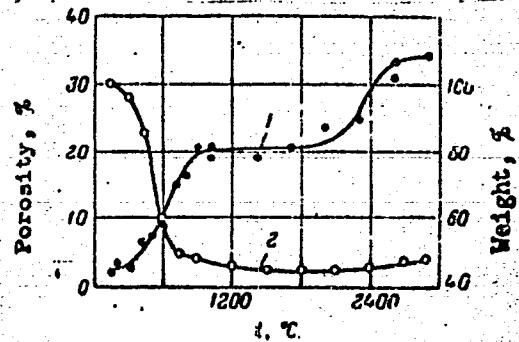

Fig. 1. Dependence of porosity (1) and weight (2) of phenol-formaldehyde resin on heating temperature.

Card 2/6

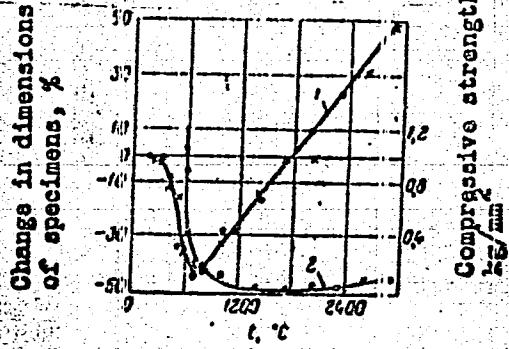

Fig. 2. Dependence of shrinkage (1) and strength of specimens of phenol-formaldehyde resin on the heating temperature.

L 24674-65

ACCESSION NR: AF5004687

The results showed that: 1) Pores and cracks develop rapidly at 400—700° C as a result of the evolution of volatile pyrolysis products. The process causes considerable weight loss and shrinkage of specimens. 2) The pores continue to develop at 700—1300° C, but at a slower rate. At the same time wide cracks are formed. These cracks cannot be determined by moisture absorption, and the magnitude of the measured porosity remains unchanged up to 1900° C. 3) At 1900—2600° C, the pores continue to develop; since specimen weight remains unchanged, it is concluded that the porosity develops as a result of an increase in the density of the coke pore walls. 4) At 2600—2900° C, the pores become filled with secondary products formed by pyrolysis-product decomposition. The specimens become blocks and acquire a metallic luster, and their weight increases slightly. 5) The specimen volume increases continuously at above 700° C and attains 150% of its initial value at 2900° C. 6) The specimen compressive strength drops from its initial value of 700—2100 kg/mm² to 0.05 kg/mm² at 1700—2600° C, and then increases again at 2900° C to 0.10 kg/mm² owing to the deposition of secondary products which fill the pores and cracks.

Card 3/6

L 24674-65

ACCESSION NR: AP5004687

The fine structure of the resin was studied by the x-ray diffraction method. The results of the study are given in the form of x-ray diffraction patterns and in the form of changes of the diffusion ring width and of interplanar spacings in the c-axis direction with temperature (see Fig. 3).

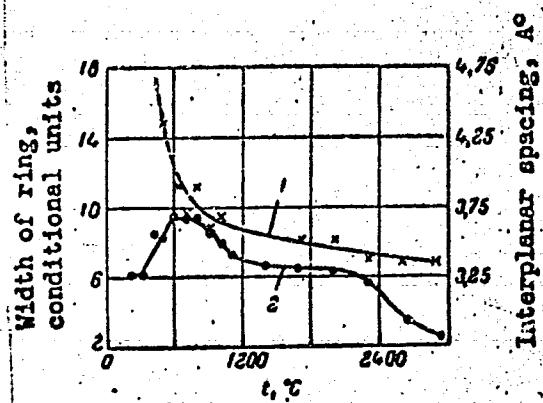

Fig. 3. Dependence of interplanar spacing and width of diffusion ring on temperature:

- 1) Intermolecular distance and interplanar spacing; 2) width of the diffusion ring.

Card 4/6

L 24674-65

ACCESSION NR: AP5004687

These results show that: 1) Heating of the resin to 250° C causes its further polymerization. 2) At 300—700° C, the resin degrades and coke structures are formed. 3) Above 800° C, the formation of primary and the ordering of secondary coke structures (bundles) continues; the two-dimensional coke-structure formation ends at 1200—1300° C. 4) At 1200—2300° C, slow growth of bundles continues. 5) At higher temperatures, in the pregraphitization period, the bundles begin to grow more rapidly; regions with a three-dimensional ordering (crystallites of graphite) appear at 2900° C. Thus during rapid heating graphitization begins at higher temperatures than during heating at a rate of 10° C/min with 2-hr holding periods, in which case graphitization begins at 2400° C.

COMMENT: The article is interesting as an apparent attempt to determine the character and possibly the rate of progressive thermal deterioration of a GRP binder at temperatures and heating rates comparable to those arising in missile combustion chambers or on the surface of re-entry plates. At the given heating rate, i.e., 170-330° C/sec, testing temperatures of 400-2900° C could be reached within the time required to reproduce approximately the thermal conditions to which GRP used for aerospace purposes is subjected. It is true that only the binders and not the GRP itself was tested, and that heat transfer was not

Card 5/6

L 24674-65

ACCESSION NR: AP5004687

studied in this series of experiments. However, a knowledge of the character of the degradation of the least resistant component is essential for further research. The low compressive-strength values obtained for the coke specimens may be of importance in evaluating the crumbling of coked material which serves as a shield for the plastic which is still intact.

TITLE: A method for microstructural analysis of fiber-glass-reinforced plastics

SOURCE: Zavodskaya laboratoriya, v. 31, no. 6, 1965, 716-717

TOPIC TAGS: plastic, fiberglass, structure analysis, resin

ABSTRACT: Microstructural analysis of the transverse sections is described as a method for quality control of fiberglass-reinforced plastics. The authors explain the shape of fibers and twisted strands in such sections and the nature of the mechanical and the chemical failures of this material. They also present a method for preparing polished sections to be used in the study of such defects as cracks and pores which determine the nature of the failure. The length of the straight cracks in the resin is limited by the distance between the layers of fiberglass. The curved cracks are normally found in the glass fibers saturated with resin. Microcracks are located at the junctions of the fibers and the binder; their width is 0.5μ and their length reaches 1 mm. The pores can be seen at the accumulations of resin and between the layers of fiberglass, are commonly of a

AUTHORS: Severov, E. A., Tikhomirova, E. I.TITLE: Cenozoic Basalts on the Southern Slope of the Mongolian Altai
(Kaynozoyskiye bazal'ty na yuzhnom skлоне Mongol'skogo Altaya)PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 127, Nr 1, pp 173-175
(USSR)

ABSTRACT: The rocks found by E. A. Severov in the valley of the Karachor Creek (catchment area of the Ku-Irtys River) are unusual in that territory. They form clearly marked shells on the peaks of not very high table mountains. According to field determinations, these rocks were identified as basalts. The shell lies practically horizontal and exhibits a visible thickness of from 10 to 50 m; its upper horizons have probably been destroyed partially by erosion. There are several exposures among these basalts, even though the total surface of the shell is not large, and does not exceed a few km². It rests upon gray and gray-green quartz-mica- and quartz-chlorite schists (Middle Devonian) and partly upon more recent, apparently Upper Paleozoic, granitoid rocks of the ^{Upper Irtysh} Batholith. The basalt shell is rather markedly stratified in the vertical

Card 1/3

SOV/20-127-1-48/65

Cenozoic Basalts on the Southern Slope of the Mongolian Altai

cross section; the thicknesses of individual horizons, however, vary strongly. The lower part is formed by massive basalts, the middle and upper parts by porous basalts. The lava surface is typical of basaltoid rocks. The petrographic investigation (made by E. O. Tikhomirova) revealed a very interesting mineral composition. The principal mineral is olivine (averaging 15%), followed by monoclinic pyroxene (25-30%), plagioclase (25-30%), potassium-feldspar (10-15%), and finally, analcime (5-10%). Table 1 shows the chemical analyses concerning these rocks. It follows therefrom that the rocks in question are very rare formations, and may be ascribed to the group of alkaline analcime-basalts. Similar basalts were described (Ref 2) as skomerites and marlesites. There are no direct indications as to the age of the basalts. Indirect indications are: (1) horizontal bedding, "freshness", and no symptoms of metamorphism. (2) absence of any hydrothermal formations that are elsewhere familiar in the territory. (3) the position of the shell in a small depressed tectonic block, namely, only in this block situated in the mountainous part of the territory. Brown-red tertiary loams lie lower

Card 2/3

SOV/20-127-1-48/65

Cenozoic Basalts on the Southern Slope of the Mongolian Altai.

hypsometrically (otherwise widely represented here). These facts are safe proofs of a more recent age of the shell, as compared with all of the known paleozoic rocks on the southern slope of the Mongolian Altai. They may quite safely be brought into parallelism with effusions of basalt lavas, which are widely spread over East Asia, especially in the territories bordering on Mongolia. However, they have not yet been found in the places described. There are 1 table and 2 references, 1 of which is Soviet.

TITLE: Influence of inertia of kardan drive on spatial stability of gyroscopic frame and floating integrating gyroscopes

CITED SOURCE: Tr. Leningr. in-t aviats. priborostr., vy*p. 40, 1963, 29-35

TOPIC TAGS: gyroscope, stability, kardan drive

TRANSLATION: The author analyzes the problem of stability of individual motion of two spatial channels of a gyroframe, the leveling of which is connected, besides the presence of a moment of centrifugal force, with inertia, depending basically on the inertia of kardan drive. It is shown that, even when each channel is individually stable, in the resultant motion of two channels of the gyroframe there may be instability.

TITLE: Forced oscillations of a monoaxial gyroscopic stabilization system having a zone of insensitivity

SOURCE: Ref. zh. Mekhanika, Abs. 1A99

REF SOURCE: Tr. Leningr. in-t aviats. priborostr., vyp. 44, 1964, 36-42

TOPIC TAGS: gyroscope stabilizer, nonlinear differential equation

TRANSLATION: Forced oscillations of a monoaxial gyroscopic stabilization system with an insensitive zone in the transmitter of the precession angle are analyzed by an approximation method based on harmonic linearization. It is shown that nonlinearity of the type considered increases the amplitude of forced oscillations in comparison with that of oscillations in a linear system. Moreover, the insensitive zone narrows the transmission belt of a closed system. The results of the analytic solution are confirmed by modeling. 3 references. P. Agaletskiy.

TITLE: On the Accuracy of the Determination of the Longitude of Points
of the First Order (O tochnosti opredeleniya dolgot
pervoklassnykh punktov)

PERIODICAL: Geodeziya i kartografiya, 1958, Nr 8, pp. 19-22 (USSR)

ABSTRACT: The error committed in astronomical longitudinal measurement is
equal to $\pm 0^{\circ},03$ and is computed according to formula (1).
Usually, the errors M_{λ} , and $M_{\Delta\lambda}$ are calculated for each astronomer
according to the data of observations carried out in the
course of one season, and $M_{\Delta\Delta\lambda}$ is assumed to be equal to
 $\pm 0^{\circ},025$. This value was obtained by A. V. Kozhevnikov after eval-
uation of 18 different determinations of the differences in ob-
served results obtained by two astronomers. The question remains
to be answered as to whether it is expedient to clear up the in-
dividual characteristic features of each astronomer, where, if
the Tsinger method and a certain method of observation are em-
ployed, the amounts M_{λ} and $M_{\Delta\lambda}$ in formula (1) are approximately
equal to one another in the results obtained by different

Card 1/4

On the Accuracy of the Determination of the
Longitude of Points of the First Order

SOV/6-58-8-3/15

astronomers ? The magnitude of $M_{\Delta\lambda}$ must, in practice, be known already with satisfactory accuracy on the occasion of the first evaluation of the first longitudinal measurements. This means that it is practically impossible for each astronomer to obtain this value in time. It is therefore more advisable to calculate the mean square of deviation for the correctional fluctuation per personal compensation of an "average" astronomer and to assume that the data used for calculation are homogeneous. Such calculations were carried out by the author, who used the data of personal compensations carried out in the course of 35 years. The following results were obtained: $m_{\Delta\lambda} = \pm 0^s,034$ and $M_{\Delta\lambda} = \pm 0^s,024$. Besides, an evaluation of accuracy of longitudinal measurement was carried out according to the data of double determination (at one and the same points) and according to those obtained by observations carried out of Laplacian double-points. In the former case $M_{\lambda} = \pm 0^s,032$ and in the latter $M_{\lambda} = \pm 0^s,033$ was obtained. As the variability of the compensation of results obtained by individual astronomers is the basic source of errors, it is this

Card 2/4

On the Accuracy of the Determination of the
Longitude of Points of the First Order

SOV/6-58-8-3/15

error that must, above all, be reduced to a minimum. This compensation becomes much more stable if a contact-micrometer is used in transits and it also becomes smaller with respect to its absolute value. The contact-micrometer was used for the first time by Engineer Kolupayev in 1950, and its use was made compulsory for triangulation of the first order in 1950 when carrying out longitudinal measurements of points of the triangulation of the I. order. On the strength of the data given here it is shown that, by the employment of the Tsinger method of longitudinal measurement and of a device with a contact-micrometer, it is possible to determine the longitudinal points of the I. order with an accuracy of 0⁸,02.

M_{λ} - mean square of deviation of the longitude of a point.

$M_{\Delta\lambda}$ - mean square of deviation of personal compensation (from two determinations).

$M_{\partial\Delta\lambda}$ - mean square of deviation of the fluctuation of the personal compensation of the astronomer.

TITLE: Copolymerization of ethylene with propylene using certain organometallic catalysts

SOURCE: Plasticheskiye massy, no. 10, 1965, 4-6

TOPIC TAGS: ethylene, propylene, copolymerization, catalytic polymerization, polymerization rate, copolymer, polymerization catalyst, organoaluminum compound

ABSTRACT: The relative activity of ethylene and propylene in their copolymerization using Ziegler-Natta catalysts was studied to obtain data necessary for the production of copolymers having valuable technical properties. The relative activity of propylene during copolymerization with different catalyst systems decreased in the following order: (1) $\text{Al}(\text{C}_2\text{H}_5)_2\text{Cl} + \text{TiCl}_4$; (2) $\text{Al}(\text{C}_2\text{H}_5)_3 + \text{TiCl}_4$; (3) $\text{Al}(\text{C}_2\text{H}_5)_3 + \text{VOCl}_3$; (4) $\text{Al}(\text{C}_2\text{H}_5)_2\text{Cl} + \alpha\text{-TiCl}_3$; and, (5) $\text{Al}(\text{C}_2\text{H}_5)_3 + \alpha\text{-TiCl}_3$. Change in catalyst concentration had no effect on the activity of the monomers. Change in the ratio of catalyst components in catalysts (4) and (5) did not change

Card 1/2

L 3912-66
ACCESSION NR: AP5024496

the composition of the copolymer, but decrease in the ratio of the aluminum alkyl in the other catalyst systems led to an increase in the propylene content in the copolymer made with catalysts (1) and (2), and a decrease in propylene when using catalyst (3). The copolymerization constants have the same values when catalyst systems (4) or (5) are used or when the $\text{Al}(\text{C}_6\text{H}_{13})_3 + \alpha\text{-TiCl}_3$ system is used, indicating that different aluminum alkyl derivatives in combination with $\alpha\text{-TiCl}_3$ do not change the relative activity of the monomers. The copolymerization constants change significantly with a change in the aluminum organic derivatives in systems based on TiCl_4 . This is apparently due to the different reductivity of the aluminum organic derivatives and subsequent formation of different active centers. Orig. art. has: 2 tables, 1 figure and 2 equations.

DETERMINING FORCED VIBRATIONS IN NONLINEAR STABILIZING SYSTEMS
(USSR)

Khovanskiy, Yu. M., P. A. Severov, and V. S. Slepkov. Izvestiya vysshikh
uchebnykh zavedeniy. Priborostroyeniye, v. 6, no. 2, 1963, 63-73.
S/146/63/006/002/007/010

An approximate method based on the use of logarithmic frequency characteristics has been used for determining forced vibrations in nonlinear gyro-stabilizing systems. The method, which consists in subdividing the linear part of a system into a number of standard units for which logarithmic frequency characteristics are well known, makes it possible to reduce the volume of computation considerably. The forced vibrations are assumed to occur at the frequency of external excitation. A numerical solution has been obtained for a stabilizing system with a stabilization motor having a limited torque. The results were checked by means of an electronic model and found to be in good qualitative agreement, the numerical difference between the two results not exceeding 1.5 db. The study was conducted at the Leningrad Institute of Aviation Instruments.

TITLE: Service performance of basic lubricants refined in
different ways

PERIODICAL: Khimiya i tekhnologiya topliv i masel, no.1, 1962,
53-59

TEXT: Engine tests at the VNII NP showed that engine oils
derived from Eastern high sulphur crudes caused ring-sticking.
In this respect alone they were worse than Baku oils, being equal
or better in all other respects. Accordingly, a study was made
of hydrocarbon group and ring structure and other properties of
various lubricants before and after engine testing. Eastern and
Baku oils were found to be generally very similar but differ in
the content of sulphur compound and in hydrocarbon structure.
Because of their constitution Eastern oils oxidise to form
oxyacids and asphaltenes which promote ring sticking. Even
though the oil-resin contents of the initial base oils were

similar, the oils from Eastern crudes produced more lacquer in the engine and in a laboratory oxidation test than did Baku oils. Oils deeply refined by solvent, acid or adsorbents were more stable, but whereas the Baku oils so refined deteriorated at a steady rate the Eastern oils displayed an induction period, being initially the more stable, but later oxidising more rapidly. Adsorption refining was particularly effective in improving the stability of the oils and reducing ring sticking with oils of Eastern crudes, giving satisfactory performance even without the use of additives. Work is in progress on hydrofined Eastern oils and preliminary indications are that this treatment gives somewhat higher VI than solvent treatment. However, hydrofined Eastern oils have inferior additive susceptibility, particularly to sulphonates, though their properties were much improved by additive 8НМ Н1-360 (VNII NP-360). Hydrofined oils with this additive behaved well in 100 and 600 hour gasoline engine tests and in 800 hour diesel engine tests. A simple comparison of certain physical properties of hydrofined Eastern oil with those of Essolube, and Shell Rimula oils, indicates that the Soviet

base oils can be as good as foreign ones. The need to match additive to base oil is emphasised.
There are 5 figures, 9 tables and 4 Soviet-bloc references.
